Schedule 1: Access Point Service Provider Accreditation Process

~~Described below are the steps a candidate Service Provider must follow to obtain the Accreditation Body's accreditation. It should be noted that the testing required for this process is essentially a 'self testing' exercise that is expected to be conducted by the candidate Service Provider. The candidate Service Provider is expected to store and upload the test results to the Accreditation Body's website for review and assessment. Outlined below is a detailed description of each step a potential Service Provider needs to perform/undergo to be accredited by the Accreditation Body.~~

Step 1 – Download the testing resources from the Accreditation Body's website.

~~The candidate Service Provider must download all the relevant testing resources published on the Accreditation Body's website. These documents will outline the testing requirements and instructions for recording the test results.~~

Step 2 – Test the solution against the testing requirements and record test results.

~~The necessary test cases must be developed by the candidate Service Provider on the basis of the test assertions provided. The candidate Service Provider is expected to 'self-test' their solution thoroughly against the test assertions. The candidate Service Provider will be expected to conduct testing exercises with testing partners (i.e. other Service Providers) and these testing partners will be determined by the Accreditation Body (based on a roster).~~

Step 3 – Upload the test results, fit and proper person's declaration and the Deed Poll to the Accreditation Body's website.

~~Upon the completion of the 'self testing' exercise of its solution and recording the test results in the required format, the candidate Service Provider is required to upload the test results to the Accreditation Body's website (as per the instructions provided on the website). The candidate Service Provider must also sign and upload the relevant Deed Poll and the fit and proper person's declaration (as required by the relevant clause(s) in the Service Provider Deed Poll).~~

Step 4 – Notification by the Accreditation Body.

~~The Accreditation Body will provide a notification to the candidate Service Provider with either a confirmation of successful accreditation or a request for more information following its assessment of the candidate Service Provider's application.~~

Schedule 3: Access Point Testing Assertions Requirements

This schedule describes the testing assertions requirements for the Accreditation Body's- AS4 profile that has been adopted for use by Access Points acting as service providers under the Accreditation Body's Interoperability Framework.

More specifically, the AS4 profile is the AS4 usage profile defined by the Technical Working Group based on the AS4 Profile of ebMS 3.0 Version 1.0 OASIS Standard. AS4 itself is based on other standards, in particular on OASIS ebXML Messaging Services Version 3.0: Part 1, Core Features OASIS Standard, which in turn is based on various Web Services specifications. The purpose of these testing assertions requirements is to focus on what is expected from the implementation.

The key terms used in this test assertion requirement description are taken from the respective implementation guides. The intended audience are Access Point service providers engaged in verifying conformance to the Accreditation Body's ebXML Messaging Services v3.0-AS4 Profile.

Entity	Description
Message Service Handler (MSH)	An entity that is able to generate and/or process messages that conform to the Accreditation Body's AS4 messagesProfile.
Producer	An entity (e.g. application) that interacts with a sending MSH to initiate the sending of a User Message.
Consumer	An entity that interacts with a receiving MSH to consume data from a received User Message.

Messaging Model

Business applications or middleware, acting as a Producer, submit message content and metadata to the sending MSH, which packages this content and sends it to the receiving MSH

of the business partner, which in turn delivers the User Message to another business applications or middleware that consumes the User Message content and metadata.

Definitions

Term	Description
User Message	A message that contains a User Message unit. It allows transmitting data interpreted by a Consumer.
Signal Message	A message that contains a Signal Message unit. It allows transmitting data interpreted by a MSH (as a signal).
MEP (Message Exchange Pattern)	<p>An agreement between sending and receiving MSHs. Some aspects of MEPs supported in the messaging layer include:</p> <ul style="list-style-type: none">➤ Specifying the correlation between messages sent and received in the message header.➤ Message binding to the underlying transfer protocol. <p>One MEP is defined in this specification, not exclusive of others:</p> <ul style="list-style-type: none">➤ The One-Way MEP, which governs the exchange of a single, User Message Unit unrelated to other User Messages. Its label is 'oneway'.
PMode (Processing Mode)	The contextual information that governs the processing of a particular message (thus is basically a set of configuration parameters).

Abbreviations

Abbreviation	Description
SMSH	A MSH in the sending role.
RMSH	A MSH in the receiving role.

Notes

- Test assertions not related to the AS4 protocol and those relating to the Digital Capability Publisher, are published in separate documents.

Formatted: Highlight

- For details on MSH's configuration, please refer to the Access Point Implementation Guide which is available on the [Council Accreditation Body's website](#). When used, configurations are described in the following test assertions as:

Configuration	PMode parameters
SMSH and RMSH are configured to exchange AS4 messages according to the Accreditation Body's AS4 profile.	PModes are set according to the Access Point Implementation Guide.
SMSH and RMSH are configured to exchange AS4 messages: One-Way/Push MEP.	<ul style="list-style-type: none"> PMode[1].MEP: set to One-way PMode[1].MEPBinding: set to Push

- In order to test some requirements, the Sending or Receiving MSHs are sometimes 'misconfigured' or 'simulated' to produce AS4 messages that do not conform to the Accreditation Body's AS4 profile. This can also be achieved by intercepting the messages and altering them before they reach their destination (e.g. by using SOAP UI). More information can be found in the following sources:

Access Point Test ~~Assertions~~Requirements

Overview

The Access Point Test Requirements cover the key functional areas required to ensure that a Service Provider's Access Point can interoperate with other Access Points. These requirements will enable the Service Provider to develop appropriate test cases in preparation for execution during interoperability testing.

The following table provides a summary of the test requirements, highlighting the focus are for each requirement.
